Bio-identical Hormone Pellets

Data supports that hormone replacement therapy with pellet implants is the most effective and the most bio-identical method to deliver hormones in both men and women.

Implants, placed under the skin, consistently release small, physiologic doses of hormones providing optimal therapy.

Pellets are made up of either estradiol or testosterone. The hormones are pressed or fused into very small solid cylinders. These pellets are larger than a grain of rice and smaller than a 'Tic Tac'.

Pellets deliver consistent, healthy levels of hormones for 3-5 months in women and 4-6 months in men. They avoid the fluctuations, or ups and downs, of hormone levels seen with every other method of delivery.

Pellets have been shown to provide *superior* relief of menopausal symptoms, maintenance of bone density, restoration of sleep patterns, and improvement in sex drive, libido,

sexual response and performance.

Testosterone delivered by a pellet implant, has been used to treat migraine and menstrual headaches, vaginal dryness, incontinence and urinary urgency and frequency. In both men and women, testosterone has been shown to increase energy, relieve depression, increase sense of well being, relieve anxiety and improve memory and concentration.

There is no other method of hormone delivery that is as convenient for the patient as the pellet implants. Pellets have been used in both men and women since the late 1930's. There is more data to support the use of pellets than any other method of delivery of hormones.

The insertion of pellets is a simple, relatively painless procedure done under local anesthesia. The pellets are usually inserted in the lower abdominal wall or upper buttocks through a small incision, which is then taped, closed.

Complications from the insertion of pellets include; minor bleeding or bruising, discoloration of the skin, infection, and the possible extrusion of the pellet. These complications are rare . Testosterone may cause a slight increase in facial hair in some women . After the insertion of the implants, vigorous physical activity should be avoided for 48 hours in women and up to 5 to 7 days in men. Some patients begin to 'feel better' within 24-48 hours while others may take a week or two to notice a difference. .

Trust Pharmacy Creations to provide compounded Bio-identical Hormone Pellets for your practice. We adhere to the highest standards in compounding pharmacy as well as all state and federal regulations. Our service is prompt, friendly and we guarantee all our products. If you are not satisfied we will replace the product or refund your payment.

One call or one fax is all you need to place an order. You can speak directly with a pharmacist, no burdensome touchtone prompts will delay your call.
